

Do you know what you know?

A team pub quiz on confidence. Students play on their phones; class data appear live on the projector.

OPEN ON THE ROOM COMPUTER

usyd-meta-lab.github.io/metacognition-tutorial

Click **Start a session** (1-hour classes) or **Start an advanced (2-hour) session**. Never "Rehearse offline" in class. Each tutorial gets its own code. Students scan the QR code, pick a team (4–5 per team) and stay anonymous.

ON THE PROJECTOR

→ ← next / previous phase ☐ P hide tutor controls and prompts
1 9 switch reveal tabs

Students move through each round at their own pace, then wait. The "Finished" counter shows when to press →. Charts update live.

Hour 1 · everyone

60 min

0–5 Lobby: QR, teams	5–10 R1 Tip of the tongue: recall + feeling of knowing	10–17 R2 How sure? 16 items + confidence	17–23 R3 Pass or play: +1 / -2 / pass 0	23–31 R4 Team round: alone, then agree	31–32 Last question: "What % did you beat?"	32–54 Reveals 1–4 (about 5 min each)	54–60 Exit ticket + leaderboard
-------------------------	---	---	--	---	--	---	------------------------------------

REVEAL 1

You couldn't recall it, but did you know you'd recognise it?

EXPECT Bars rise left to right: people knew something about answers they could not retrieve.

ASK What were you monitoring, if not the answer itself? (Monitoring without retrieval; Hart, 1965.)

REVEAL 2A / 2B

When you said 80%, were you right 80% of the time?

EXPECT Black = all items, grey = normal, orange = deceptive. Below the dashed line = overconfidence, worst on deceptive items. Tab 2b: bias and resolution are separate.

ASK Which question fooled the room? Who is well calibrated but can't tell right from wrong answers?

REVEAL 3

Did passing pay?

EXPECT Answers people played were far more accurate than ones they passed. Most students beat "play everything".

ASK Monitoring is only worth points when it drives control. How does this apply to your exam?

REVEAL 4

Did your team beat its members?

EXPECT Black = team discussion, then majority, confidence-weighted, most confident, best and average member. Deceptive items: no rule helps.

ASK How did your team decide? Did the most confident voice win? (Bahrami et al., 2010.)

EXIT TICKET Each student writes one change to how they will prepare for the exam, based on today's data. Then show the Leaderboard tab.

Hour 2 · advanced only: whom should you trust?

60 min · uses the hour 1 data

60–65 Break. Hand out the trust-policy sheet	65–80 Part 1 Yourself: Dunning–Kruger, tabs a–c	80–100 Part 2 An advisor: estimates, advice, reveal a–d	100–112 Part 3 The group: tabs a–b	112–120 Groups read out their trust policy
---	--	--	---------------------------------------	---

PART 1 · TAB A

Do you know how good you are?

EXPECT Black = actual, orange = estimated percentile: the bottom quarter overestimates. Tab b: pure noise gives the same plot. Tab c: is resolution worse in the bottom quarter?

ASK What would show a real metacognitive deficit? Policy rule 1: when can self-assessment be trusted?

PART 2 · TAB B

Should you have moved more?

EXPECT Error of first answer, final answer, a simple average with the advice, and the advice alone. People move only ~30% (tab a); averaging beats that.

ASK Why does your own answer feel more trustworthy? Policy rule 2: when should we defer, and how much?

PART 3 · TAB A

When should confidence decide?

EXPECT Confidence-weighting helps when most people are right, but not on deceptive items, where confidence tracks consensus (Koriat, 2012).

ASK Policy rule 3: what protects a hiring panel or clinical team from a confident wrong consensus?

IF SOMETHING GOES WRONG

- A phone is stuck on an old screen: it re-checks every few seconds; otherwise reload the page (answers are kept).
- Fewer than about 12 students: press **Load simulated class**. It exists on the projector only and is never saved.
- Red "Can't reach the live database" banner: try another network, or tell Kit.
- Don't press **Clear session data** during class: it deletes the session's responses.

THINGS TO SAY

- Start: "Points for being right, and for knowing *when* you're right."
- Answers are anonymous. Each phone shows a private summary of that student's own results during the reveals.
- Lecture links: L1 monitoring, control, calibration vs resolution; L2 Dunning–Kruger; L3 study regulation, groups, advice.
- Close: "Confidence is only useful when it tracks accuracy."
